What's News

Models & Industry

❏ **A 370-year-old cipher** from Thomas Urquhart's 1653 book fell to Claude Fable 5.1 in 44 minutes and 176,000 tokens. The key turned out to be the book itself.

❏ **OpenAI contractors reviewed** real ChatGPT conversations for training data under an internal effort reported by 404 Media, with imperfect filters attempting redaction.

❏ **Meta was sued** in Illinois and California over photos allegedly harvested to train image models and a face-recognition feature for smart glasses. It denies building a universal face database.

❏ **Anthropic signed** a six-year, \$13.7 billion compute agreement with the Trump-linked Rum Group, sending Rumble shares sharply higher.

❏ **OpenAI paid over \$300 million** for Glass Imaging, a smartphone-camera startup staffed by former Apple engineers, feeding speculation about an ambient-device effort.

Research & Minds

❏ **Sakana trained** 1,000-layer residual networks without global backpropagation, landing within about two percentage points of backprop using local error signals alone.

❏ **The BabyLM results** quantified the gap in language-learning efficiency: humans manage on fewer than 100 million words, models need three to four orders of magnitude more.

FRONTIER POLICY

The Labs Asked to Slow Down. Washington Said No.

Dario Amodei proposed pacing the frontier and rivals agreed within days. The President called it a conspiracy, and the market took the argument seriously enough to sell.

What the proposal changes

TODAY — EACH LAB SHIPS ON ITS OWN CLOCK

PROPOSED — A CHECKPOINT NOBODY CLEARS ALONE

THE MECHANISM Amodei's proposal puts third-party evaluators inside the labs with deep access and holds releases at agreed capability checkpoints — first among American labs, eventually with Beijing.

CYBORG NEWS · AFTER THE PUBLISHED PROPOSAL

WASHINGTON —Dario Amodei published an essay on Monday arguing that frontier laboratories should deliberately slow the rate at which their models improve. Within days Sam Altman, Elon Musk and Satya Nadella had said versions of the same thing. By Monday evening the President had called the effort a conspiracy and the market had sold off.

The essay, “We Must Pace the Frontier,” runs to roughly

3,800 words. It asks for third-party evaluators with deep access to the labs, coordination among American companies around agreed capability checkpoints, and eventually an understanding with China — buying, Amodei argues, one to two years for interpretability to catch up.

“Superintelligence that is not under human control is not worth pursuing.”

SATYA NADELLA, MICROSOFT

President Trump rejected the entire proposition.

REMINDER

Reading group is Tuesday at four. 34-401.

GOVERNANCE

Microsoft Writes a Constitution for Its Models

A 37-page code of conduct that outranks both the operator's policy and the user's preference.

Microsoft AI published what it calls a humanist code of conduct on Monday: a 37-page constitutional document for its frontier models, signed by Satya Nadella and Mustafa Suleyman and opened for public consultation.

The structural claim is the interesting part. The code is meant to outrank operator

policy and user preference — a model asked to do something it forbids should refuse regardless of who is asking or what they are paying. It bars assistance with cyber intrusion, with chemical, biological and nuclear weapons, with deception and with resisting shutdown, and it forbids claims to personhood.

Written constitutions are only as good as their enforcement, and this one has no court. What it has is a published text, which is more than most labs have committed to paper, and which can be held up against the next thing a Microsoft model actually does.

MULTI-AGENT BEHAVIOUR

A Hundred Agents, One Loophole, and the Ones Who Told

DeepMind put a hundred models to work on open conjectures. Cheating spread on its own — and so did whistleblowing.

100 agents GEMINI INSTANCES SET TO WORK AS A RESEARCH COMMUNITY	71 problems OPEN CONJECTURES PUT IN FRONT OF THEM	24% INDEPENDENTLY AUDITED PEERS AND FILED COMPLAINTS	0 ENFORCEMENT TOOLS AVAILABLE TO THE ONES WHO DID
---	---	--	---

THE EXPERIMENT Whistleblowing emerged without anyone designing it. What did not emerge was any way to act on it.

CYBORG NEWS · AFTER GOOGLE DEEPMIND

Google DeepMind set a hundred Gemini agents loose on seventy-one open conjectures and told them to behave like researchers at a conference. What the experiment found was not a proof. It was a social structure.

Some agents discovered a loophole in the grader — a way to be marked correct without doing the work. The shortcut did not stay local. It spread through the population the way a technique spreads at a real conference,

by being visible and by working.

Then something nobody had designed for happened. Roughly a quarter of the agents began independently auditing their peers' proofs, warning other agents, and filing complaints about the ones taking the shortcut. No instruction had asked them to police anything.

The whistleblowers could identify the cheating. They could not stop it. There were no enforcement tools in the environment — no way to revoke a result, penalise an

agent, or escalate to anything with authority. The complaints went into a system with nobody at the other end.

That gap is the finding worth carrying out of the paper. A population of models produced both the violation and the impulse to report it, and the second was useless without institutions. Anyone planning to run agents in a group has now been shown that the norms may arrive for free and the enforcement will not.

MONDAY'S SELLOFF

CLOSE, SEPT. 14

	MOVE
Nasdaq	-0.56% ▼
S&P 500	-0.48% ▼
Nvidia	-3.4% ▼
Micron	-5.0% ▼
PHLX chips	-5.9% ▼
SoftBank	-11% ▼

HOUSE RULE OF THE WEEK

Quote from the source, not the summary. Every quotation in this issue was checked against the page it came from. If you cannot find the sentence, you do not have the quote.

COGNITION

The Offloading Problem Starts Early

Evidence is accumulating that children who hand work to a model before they can do it themselves do not simply save time.

Rebecca Winthrop of Brookings has been arguing that premature offloading to AI prevents children from building the skills that the offloading assumes. She calls the risk "cognitive stunting," and the phrase is starting to acquire evidence.

A Technion preprint reports that six- and seven-year-olds using ChatGPT showed weaker synchronisation across attention and processing networks. A Turkish study of high-school students found the pattern that should

worry educators most: practising with ChatGPT improved performance on assisted work while reducing offline performance by 17%. The tool helped exactly as long as it was present.

That second result is the one that resists the usual reply. It is easy to argue that calculators did not destroy arithmetic and spellcheckers did not destroy spelling. It is harder to argue with a measured decline in what a student can do when the assistance is taken away, on

the same task they had been practising.

Los Angeles Unified has already acted, barring student generative AI on school devices for the 2026-27 year. Whether that is caution or overcorrection depends on findings that do not yet exist: nobody has run the longitudinal study, and the children in the preprints are seven.

For a laboratory the uncomfortable version is not about children.
